Upload a file to CPAN

Add a file for CJUAN

File successfully copied to '/home/ftp/incoming/Ham-Resources-HamQTH-0.02.tar.gz'

Submitting query

Query succeeded. **Thank you for your contribution**

As it is done by a separate process, it may take a few minutes to complete the upload. The processing of your file is going on while you read this. There's no need for you to retry. The form below is only here in case you want to upload further files.

Please tidy up your homedir: CPAN is getting larger every day which is nice but usually there is no need to keep old an outdated version of a module on several hundred mirrors. Please consider removing old versions of your module from PAUSE and CPAN. If you are worried that someone might need an old version, it can always be found on the backpan

Debugging: you may want to watch the temporary directory where your submission should show up soon: ftp://pause.perl.org/tmp/C/CJ/CJUAN (be patient, this directory may not exist yet). If it passes some simple tests, it will be uploaded to its final destination. If something's wrong, please check the logfile of the daemon. See the tail of it with https://pause.perl.org/pause/authenquery?ACTION=tail_logfile& pause99_tail_logfile_1=5000. If you already know what's going wrong, you may wish to visit the repair tool for pending uploads.

This form enables you to enter one file at a time into CPAN in one of these ways:

HTTP Upload: As an HTTP upload: enter the filename in the lower text field. **Hint:** If you encounter problems processing this form, it may be due to the fact that your browser can't handle `multipart/form-data` forms that support file upload. In such a case, please retry to access this file-upload-disabled form.
GET URL: PAUSE fetches any http or ftp URL that can be handled by LWP: use the text field (please specify the *complete URL*). How to use this for direct publishing from your github repository has been described by Mike Schilli in his blog
FTP PUT + Confirmation via form: After you have transferred the file to the incoming directory on pause.perl.org: Click the filename.

> **Please,** make sure your filename contains a version number. For security reasons you will never be able to upload a file with the same name again (not even after deleting it). **Thank you.**

There is no need to upload README files separately. The upload server will unwrap your files (.tar.gz or .zip files only) within a few hours after uploading and will put the topmost README file as, say, Foo-Bar-3.14.readme into your directory. **Hint:** if you're looking for an even more convenient way to upload files than this form, you can try the `cpan-upload` script in Neil Bowers' directory.

Target Directory

If you want to load the file into a directory below your CPAN directory, please specify the directory name here. Any number of subdirectory levels is allowed, they all will be created on

the fly if they don't exist yet. Only sane directory names are allowed and the number of characters for the whole path is limited.

[   ]

Upload Material

If **your browser can handle file upload**, enter the filename here and I'll transfer it to your homedirectory:

[   ] Examinar...

[Upload this file from my disk]

If you want me **to fetch a file** from an URL, enter the full URL here.

[   ]

[Upload this URL]

If **you have already uploaded** the file to PAUSE, click here, which file is yours
